UNILENE MESH

Monofilament Polypropylene Mesh

UNILENE MESH – Non Absorbable Polypropylene Surgical Mesh

DESCRIPTION

UNILENE polypropylene mesh is constructed of knitted filaments of extruded polypropylene identical in composition to that used in UNILENE Polypropylene Suture. This material, when used as a suture, has been reported to be nonreactive and to retain its strength indefinitely in clinical use.

UNILENE mesh is knitted by a process which interlinks each fiber junction and which provides for elasticity in both directions. This construction permits the mesh to be cut into any desired shape or size without unraveling. This bi-directional elastic property allows adaptation to various stresses encountered in the body

INTENDED USE

This mesh may be used for the repair of hernia and other facial deficiencies that require the addition of a reinforcing or bridging material to obtain the desired surgical result. UNILENE mesh is a non absorbable mesh used to span and reinforce traumatic or surgical wounds to provide extended support during and following wound healing. The material is not absorbed nor is it subject to degradation or weakening by the action of tissue enzymes.

- Mesh Characteristics: Non Absorbable, Sterile, Surgical, Polypropylene Mesh
- Type: Knitted filaments of extruded Polypropylene
- Material: Polypropylene
- Color: Undyed
- Absorption: Non absorbable
- Sterilization: EO (Ethylene Oxide)
- Product Characteristics: Light weight construction because of which less foreign mass in the body & flexible scar tissue. Macro porous for high visibility and colonization
- Packaging: Double packed in a tyvek and a medical grade pouch
